2-(4-ARYL OR HETEROARYL-PIPERAZIN-1-YLMETHYL)-
1H-INDOLE DERIVATIVES

Background of the Invention

The present invention relates to 2-(4-aryl or heteroaryl-piperazin-1-ylmethyl)-1H-indole derivatives possessing central dopaminergic activity. Such compounds are useful in the treatment of Central Nervous Systems (CNS) disorders. This invention also relates to a method of using such compounds in the treatment of the above disorders in mammals, especially humans, and the pharmaceutical compositions useful therefor.

It is generally known that dopamine receptors seem to be important for many functions in the animal body. For example, altered functions of these receptors participate in the genesis of psychosis, drug addiction, compulsive disorders, bipolar disorders, vision, emesis, sleep, feeding, learning, memory, sexual behavior, regulation of immunological responses and blood pressure. Since these receptors control a great number of pharmacological events, not all of them are presently known, there is a possibility that compounds acting preferentially on D4 dopamine receptor may exert a wide range of therapeutic effects in humans.

The 2-(4-aryl or heteroaryl-piperazin-1-ylmethyl)-1H-indole derivatives of the present invention, including forms of tautomers, enantiomers and acceptable acid addition salts, are centrally acting D4-dopamine receptor agonists and thus are useful as cognition enhancers and treatment of CNS diseases, such as Parkinsons disease, Alzheimer's disease, learning and memory abnormalities. Another feature of this invention provides for the use of combinations of compounds of the present invention in conjunction with D1, D2, D3 or D5 dopamine receptor agonists, such as L- dopa and D2 agonists, in treatment of CNS diseases, such as Parkinson's disease, Alzheimer's disease, attention deficit disorder and learning and memory abnormalities.

Detailed Description of the Invention

The following reaction Schemes illustrate the preparation of the compounds of the present invention. Unless otherwise indicated a, T, V, X, Y, Z, R¹, R², R³, R⁴, R⁵, R⁶, R⁷, R⁸ and R⁹ in the reaction Schemes and the discussion that follow are defined as above.

10

Scheme 1

5

Scheme 2

5 In reaction 1 of Scheme 1, the compounds of formula III and IV are coupled to form the corresponding compound of formula I by first treating III with O-, N- dimethyl hydroxylamine hydrochloride, dicyclohexylcarbodiimide and a base, such as triethylamine, in a polar aprotic solvent, such as methylene chloride. The hydroxamide intermediate so formed is reduced, using a reducing agent such as lithium aluminum
10 hydride, in a polar aprotic solvent, such as tetrahydrofuran. The reductive amination of the aldehyde intermediate so formed is accomplished by reacting the aldehyde with the compound of the formula IV in the presence of sodium triacetoxyborohydride and a polar aprotic solvent, such as dichloroethane. The reaction mixture is stirred, under inert atmosphere, at room temperature for a time period between about 40 hours to
15 about 56 hours, preferably about 48 hours.

In reaction 1 of Scheme 2, the compounds of formula VI, wherein L is a leaving group such as chloro, bromo, methoxy or any activated ester derivative such as para-nitro phenyl ester, hydroxy benzotriazole ester, N-hydroxysuccinimide ester or hydroxy, and IV are coupled to form the corresponding methanone compound of formula III by
20 reacting VI and IV in the presence of diisopropylethylamine, carbodiimide or a dehydrating agent and a polar aprotic solvent, such as methylene chloride, or in form of mixtures containing, if desired, combinations of organic solvents or water such as combinations of cyclic and acyclic mono and dialkylamides, (C₁-C₄) alcohols, halogenated solvents, or acyclic and cyclic alkylethers at temperatures ranging from
25 about 0°C to about 150°C, preferably about 0°C or the boiling point of the same solvent mixture. Addition of an acid acceptor such as an alkalicarbonate, a tertiary amine or a similar reagent may be useful.

In reaction 2 of Scheme 2, the methanone compound of formula V is converted to the corresponding compound of formula I, wherein R³ and R⁴ are hydrogen, by
30 reducing V with a reducing agent, such as lithium aluminum hydride or a borane derivative, in the presence of a polar aprotic solvent, such as tetrahydrofuran, for a time period between about 10 hours to about 14 hours, preferably about 12 hours.

In each of the above reactions, pressure is not critical. Pressures in the range of about 0.5 atmospheres to 3 atmospheres are suitable, and ambient pressure (generally,
35 about one atmosphere) is preferred as a matter of convenience. Also, for those reactions where the preferred temperature varies with the particular compounds reacted, no preferred temperature is stated. For such reactions, preferred

5 temperatures for particular reactants may be determined by monitoring the reaction using thin layer chromatography.

The novel compounds of the formula I and the pharmaceutically acceptable salts thereof (herein "the therapeutic compounds of this invention") are useful as dopaminergic agents, i.e., they possess the ability to alter dopamine mediated neurotransmission in
10 mammals, including humans. They are therefore able to function as therapeutic agents in the treatment of a variety of conditions in mammals, the treatment or prevention of which can be effected or facilitated by an increase or decrease in dopamine mediated neurotransmission.

The compounds of the formula I that are basic in nature are capable of forming a
15 wide variety of different salts with various inorganic and organic acids. Although such salts must be pharmaceutically acceptable for administration to animals, it is often desirable in practice to initially isolate a compound of the formula I from the reaction mixture as a pharmaceutically unacceptable salt and then simply convert the latter back to the free base compound by treatment with an alkaline reagent and subsequently convert the latter
20 free base to a pharmaceutically acceptable acid addition salt. The acid addition salts of the base compounds of this invention are readily prepared by treating the base compound with a substantially equivalent amount of the chosen mineral or organic acid in an aqueous solvent medium or in a suitable organic solvent, such as methanol or ethanol. Upon careful evaporation of the solvent, the desired solid salt is readily obtained. The
25 desired acid salt can also be precipitated from a solution of the free base in an organic solvent by adding to the solution an appropriate mineral or organic acid.

The therapeutic compounds of this invention can be administered orally, transdermally (e.g. through the use of a patch), parenterally or topically. Oral administration is preferred. In general, these compounds are most desirably administered
30 in dosages ranging from about 0.1 mg up to about 1000 mg per day, or 1 mg to 1000 mg per day in some cases, although variations may occur depending on the weight and condition of the person being treated and the particular route of administration chosen. In some instances, dosage levels below the lower limit of the aforesaid range may be more than adequate, while in other cases still larger doses may be employed without causing
35 any harmful side effect, provided that such larger doses are first divided into several small doses for administration throughout the day.

5 The therapeutic compounds of the invention may be administered alone or in combination with pharmaceutically acceptable carriers or diluents by either of the two routes previously indicated, and such administration may be carried out in single or multiple doses. More particularly, the novel therapeutic compounds of this invention can be administered in a wide variety of different dosage forms, i.e., they may be combined with various pharmaceutically acceptable inert carriers in the form of tablets, capsules, lozenges, troches, hard candies, powders, sprays, creams, salves, suppositories, jellies, gels, pastes, lotions, ointments, elixirs, syrups, and the like. Such carriers include solid diluents or fillers, sterile aqueous media and various non-toxic organic solvents, for example. Moreover, oral pharmaceutical compositions can be suitably sweetened and/or
10 flavored.

For oral administration, tablets containing various excipients such as microcrystalline cellulose, sodium citrate, calcium carbonate, dicalcium phosphate and glycine may be employed along with various disintegrants such as starch (and preferably corn, potato or tapioca starch), alginic acid and certain complex silicates, together with
20 granulation binders like polyvinylpyrrolidone, sucrose, gelatin and acacia. Additionally, lubricating agents such as magnesium stearate, sodium lauryl sulfate and talc are often very useful for tableting purposes. Solid compositions of a similar type may also be employed as fillers in gelatin capsules; preferred materials in this connection also include lactose or milk sugar as well as high molecular weight polyethylene glycols. When
25 aqueous suspensions and/or elixirs are desired for oral administration, the active ingredient may be combined with various sweetening or flavoring agents, coloring matter or dyes, and, if so desired, emulsifying and/or suspending agents as well, together with such diluents as water, ethanol, propylene glycol, glycerin and various like combinations thereof.

For parenteral administration, solutions of a compound of the present invention in either sesame or peanut oil or in aqueous propylene glycol may be employed. The aqueous solutions should be suitably buffered if necessary and the liquid diluent first rendered isotonic. These aqueous solutions are suitable for intravenous injection purposes. The oily solutions are suitable for intra-articular, intramuscular and
35 subcutaneous injection purposes. The preparation of all these solutions under sterile conditions is readily accomplished by standard pharmaceutical techniques well known to those skilled in the art.

5 Additionally, it is also possible to administer the compounds of the present invention topically when treating inflammatory conditions of the skin and this may preferably be done by way of creams, jellies, gels, pastes, ointments and the like, in accordance with standard pharmaceutical practice.

10 The ability of compounds to bind to mammalian dopamine receptors, and the relative ability of compounds of this invention to inhibit [3 H]-spiperone binding to human dopamine D_4 receptor subtypes expressed in clonal cell lines was measured using the following procedure.

D_4 Receptor Binding Ability

 The determination of D_4 receptor binding ability has been described by Van Tol, et al. (Nature, 1991, 350, 610). Clonal cell lines expressing the human dopamine D_4 receptor are harvested and homogenized (polytron) in a 50 mM Tris:HCl (pH 7.4 at 4 °C) buffer containing 5 mM EDTA, 1.5 mM calcium chloride ($CaCl_2$), 5 mM magnesium chloride ($MgCl_2$), 5 mM potassium chloride (KCl) and 120 mM sodium chloride (NaCl). The homogenates are centrifugated for 10-15 min. at 48,000 g, and the resulting pellets resuspended in a buffer at a concentration of 150-250 mg/ml. For saturation experiments, 0.75 ml aliquots of tissue homogenate are incubated in triplicate with increasing concentrations of [3 H]-spiperone (70.3 Ci/mmol; 10-3000 pM final concentration) for 30-120 minutes at 22 °C in a total volume of 1 ml. For competition binding experiments, assays are initiated by the addition of 0.75 ml of membrane and incubated in duplicate with the indicated concentrations of competing ligands (10^{-14} - 10^{-3} M) and/or [3 H]-spiperone (100-300 pM) for 60-120 min at 22°C. Assays are terminated by rapid filtration through a Brandell cell harvester and the filters subsequently monitored for tritium as described by Sunahara, R.K. et al. (Nature, 1990, 346, 76). For all experiments, specific [3 H]spiperone binding is defined as that inhibited by 1-10 mM (+)-butaclamol. Binding data are analyzed by non-linear least square curve-fitting. The compounds of the Examples were tested in this assay, and all were found to have binding affinities (K_i) for the displacement of [3 H]-spiperone of less than 2 micromolar.

Human D4 receptor modulation of cAMP formation

Chinese hamster ovary (CHO) cells expressing the human D4.4 dopamine receptor were obtained from Dr. H. Van Tol (Clarke Institute of Psychiatry, Toronto), and were grown to confluence in Minimal Essential Alpha Media (Gibco) supplemented with 2.5% Fetal Bovine Serum (not heat inactivated), 2.5% Equine Serum (heat inactivated), and 500 µg/ml Geneticin. Monolayers were disrupted and cells dislodged with 5 mM ethylenediaminetetraacetic acid (EDTA) and resuspended in phosphate buffered saline buffer containing 5 mM magnesium chloride, 30 mM hydroxyethylpiperazine-N-ethanesulfonic acid (HEPES), 300 µM 3-isobutyl-1-methyl-xanthine (IBMX, a phosphodiesterase inhibitor), and 5.6 mM dextrose. Cells (approximately 200,000/tube) were exposed to 5 µM forskolin (an adenylate cyclase activator), forskolin plus test compounds or quinpirole (a D4 receptor agonist), or forskolin plus quinpirole plus antagonist for 11 minutes. In experiments with antagonists, cells were exposed to antagonists 11 minutes prior to agonist challenge. The effect of test compounds in the absence of the agonist quinpirole was used to judge agonist activity. D4 agonists produce an inhibition of cAMP accumulation which can be reversed by D4 receptor antagonists. The reaction was terminated with the addition of 6N perchloric acid, and samples neutralized with 5N potassium hydroxide and 2M Tris buffer. Cyclic AMP levels were measured using a commercially available competitive binding kit (Amersham). IC₅₀ values were calculated by linear regression analysis of the concentration-response curves. K_i values were calculated using the equation: $K_i = IC_{50}/(1 + [agonist]/[agonist EC_{50}])$ (Minneman and Johnson, 1984).

The present invention is illustrated by the following examples, but it is not limited to the details thereof.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/IB 98/01198

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
Although claims 10 - 17 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/ composition.
2. ☐ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
☒ No protest accompanied the payment of additional search fees.
